Clyde Canlas: Goodmorning panel we are group pokelicious and we are here to present our study VerifyID: Online Barangay System with Identity Authentication through Integration of Image Recognition Presented by:Clyde Canlas, Jhon mark Enrique, Patrick Formanes, John Elvin Recto

John Elvin Recto:We created a website called VerifyID to validate residents' valid IDs through live face scanning. Right now, it's done by manual process which, which takes a long time and can lead to mistakes.VerifyID will use facial recognition to quickly confirm barangay residents identity.We're also making sure it's good quality, works well, is easy to use, and fasten the process.Basically, we want to make things easier, more secure and faster for everyone in the barangay.The objective of our study is to replace slow process, error-prone manual ID checks at barangays. We aim to build it, ensure its quality, optimize its accuracy, and confirm user satisfaction.

Patrick Formanes: Good morning panels my name is Patrick Formanes and I am here to present the scope and limitation of our study. Essentially, it's a dedicated online platform for Barangay 781 Zone 85 residents We've integrated facial recognition, The system handles certificate requests, news updates, and resident inquiries, all with the goal of improving efficiency, for limitation. This is specifically for Barangay 781 Zone 85, facial recognition can be impacted by image quality and lighting. We don't handle payments within the system, and we're currently limited to nine certificate types and specific ID types. Also, document approvals are currently manual.

Clyde Canlas: The research design serves as the blueprint of our study, outlining how data is collected, analyzed, and interpreted. We used three approaches namely Descriptive, Experimental, and Developmental Research.First is the Descriptive Research, we used this approach to know and understand the existing processes of the barangay. Processes like requesting certificates, how residents apply certificates from the barangay, second is how do barangay officials validate the identity of residents and lastly what are the challenges faced in terms of using the traditional method.Second one is the Experimental Research that was conducted to evaluate the effectiveness of the image recognition algorithms. This is where we will know what algorithm is the most suitable and what algorithm is going to be integrated in the system. We used the confusion matrix which consists of Precision, Recall, Accuracy and F1 score to evaluate each modelThe last research design is the Developmental and it is used to design, build and refine the verifyid system. The objective of this research is to develop the web based barangay system with the chosen image recognition algorithm which solves the challenges the barangay are currently facing. This is basically the website that both the

residents and the barangay officials will use for their own convenience. Survey via google forms is used to evaluate the website.

John Elvin Recto: The development of Barangay 781 Zone 85's VerifyID system followed an Agile Methodology, emphasizing flexibility and responsiveness. Plan: We collaborated with the barangay, using visual tools to present the system's features and overall design. Design: We designed both the user-facing and technical aspects of the system, incorporating three algorithms for optimal performance. The YOLOv8, CNN, FASTER-R CNN. Develop: This phase involved building the system based on the established design and layout. Test: We tested the accuracy, and effectiveness in verifying user identities. The assessment process involves testing the model against various conditions, analyzing its predictive capabilities, and refining it based on performance metrics. Deploy: This stage ensures that the system is fully operational, accessible to end-users, and configured for secure identity verification through facial recognition technology. The system is deployed in Google Cloud Platform with domain from godaddy. Review: We presented progress to stakeholders, gathered feedback, and adjusted the project plan to align with goals and user needs. Launch: This phase marked the official release of the system for general use.

Clyde Canlas: Data collection and analytical techniques. The survey is designed to collect feedback based on ISO 25010 specifically the functional suitability, performance efficiency, compatibility and security. The questions were structured to assess user experience, accuracy of facial recognition, and efficiency of automated certificate requests. The analytical technique used to analyze the survey responses is the Descriptive statistics and these are the mean, median and mode and these are used to determine the user satisfaction and system efficiency. We used this to know the summary of the data collected and to also know the performance of the system. The researchers evaluated the model using a confusion matrix. We used this to determine the best regarding performance and this is our basis on what model is going to be integrated in the system

John Mark Enrique: Algorithms tested on the system were CNN, Fast-R CNN and Yolo v8. So in algorithm we choose to combine the CNN and yolo v8. So in Yolo V8 image recognition or the face recognition to speed up things so that the CNN can extract the facial points and extract the landmarks. So frameworks that was used are laravel version 11 that serves as our server side and our back end side and bootstrap version 5.3 that serves as front end so it can maximize the responsiveness and aesthetics of the website.

John Mark Enrique: So for the Demo This is the website of the Barangay 781 zone 85. So the user needs to create an account before it can request a certificate. So in the

creation of the account, the barangay requested us to make it a tagalog version of account policy and terms and conditions and data privacy. So this is the account policy and this is the terms and condition. This is our data privacy act. Then kailangan nila i double check yung terms and condition and data privacy.

Era Marie F. Gannaban: Uhm Mr. Enrique, sorry to interrupt. Can you tell me exactly where your functional requirements are so that I can follow the demonstration of the page number in your documentation. Okay na nakita kona. So nasan na User authentication?

John Mark Enrique: Yes po ma'am, so yun uhm check list for terms and condition and data privacy then click the sumasang ayon ako. and if not click hindi ako sumasang ayon. Then we implement a five step of creating an account. The email verification, resident information, household information, valid id's and face scan. so in email it will send an otp to the email registered. So the otp was sent successfully. Verify the otp. So in the password you must include at least one capital letter, at least one number and at least one special character. So the next step is personal information. It includes the last name, first name, middle name. So date of birth age, phone number and gender at birth civil status and indicate if labor, employed or employer, unemployed, pwd, senior, solo parent.

Lester G. Diampoc: What do you mean by labor?

John Mark Enrique: Uhm other term for employed po.

Lester G. Diampoc: Ah edi employed nalang ilagay niyo.

John Mark Enrique: Uhm kasi binase po namin doon sa RBI po nila. So next step after natin ma fill up yung information. Proceed tayo sa house hold information so next, in this part dito po nag start ang integration of our algorithm. Whereas dedetect yung face dun sa uploaded valid ID. So yung dun sa pag upload ng valid is maximum file size of 5mb maximum number of file is one. And accepted only PNG, JPEG and JPG. and proceed to face scan

Lester G. Diampoc: may mga naka specify ba na ID na accepted

John Mark Enrique: Yes only ang accepted po namin is Philhealth, sss student id and driver's license

Lester G. Diampoc: So I suggest na i include nyo jan yung accepted ID's para aware or di na mag tritrial and error yung residents.

Jhon Mark Enrique: So itong face scan, sa front, so yung front face iscan and face a little to the left. So face kalang ng konti sa left. And after sa left side is punta tayo sa right side, so after nung sa right side we can now create an account but note that make sure that there is enough light around, remove all accessories na nakaharang sa ating muka then once na create na yung account we can log in and mag didisplay yuing "account has been successfully created " and the registration number of the resident and a message that your account has been successfully created we can now proceed to access your account. Please remember to capture or save your registration number. So moving on to the landing page, So we can now access our credentials note that every login magkaroon tayo ng log in notification and mag email sakinila kung kelan sila nag log in, anong device gamit and kelan naglog in. So once naka log in is mag didisplay na si banner ng we are now online and we can now request a certificate or permits. Meron tayong banner para sa steps and anong pwedeng mga certificate yung pwedeng i request. So for example is mag re request tayo ng barangay indigency. So you will see the requirements na meron siya and ano yung mga available purpose na meron ang barangay indigency ang meron lang sa system natin and sa request part dito papasok yung pag fill up ng form and makakapag submit ng request ng indigency. So if voters ilang copy, name of requester and ano yung purpose ng pag request ng barangay indigency then submit. Request submitted successfully. Meron din tayong red button means na we can cancel the request. So to approve the request we need to Logout. We need to access the admin part so si admin ang mag aapprove ng mga request ng mga certificate natin. So once na login si admin mapupunta tayo sa admin dashboard. Nandito yung statistical part namin. But for now we need to approve the requested certificate. Barangay indigency request we have for approval claimed and unclaimed.

Lester G. Diampoc: Who accesses the admin?

John Mark Enrique: Secretary po sir

Lester G. Diampoc:Pano pag wala si admin?

John Mark Enrique: uhm yung record keeper napo ang maghahandle sa admin side

Lester G. Diampoc: Okay pano for example wala silang parehas?

Jhon Mark Enrique: Si chairman napo ang papasok

Lester G. Diampoc: Pinagkakaabalahan paba to ni chairman? Hindi ba pwedeng si kagawad muna bago si chairman?

Jhon Mark Enrique: uhm base po sa interview natin sa kanila silang tatlo palang daw po pwedeng makapag handle sa system namin.

Lester G. Diampoc: Kasi parang sobrang busy na kasi ni chairman para mag approve and mag check ng mga status

Jhon Mark Enrique: So we can decline and state natin kung ano yung reason kung bakit declined yung certificate na nirequest niya

Lester G. Diampoc: What are the possible reasons that the request will be declined?

Jhon Mark Enrique: Possible reasons po is kulang yung requirements na pinasa, mali yung information na nakalagay or may part po sila na inaalam kung botante ba or hindi.

Lester G. Diampoc: So either magpakita kayo ng sample no? So yung mga difference you should be able to mimic that on your presentation. So para ma test natin yung actual transaction if ever na the system will be deployed in the barangay so yung mga possible scenario

Jhon Mark Enrique: So next is meron tayong button dito mamimili tayo kung sino yung pangalan ng kagawad na pipirma doon sa certificate so for example is Chairman nila then convert to pdf then lalabas dito yung certificate na nirequest niya. Next part is once na print na yung certificate.

Lester G. Diampoc: Wait excuse me, galing sa barangay yang picture nayan?

John Mark Enrique: Yes po.

Abelardo T. Bucad: Dynamic ba yung picture? Napapalitan bayan?

John Mark Enrique: For now po sir is ang napapalitan palang po sakaniya is yung contents lang po

Abelardo T. Bucad: Pag iba na yung barangay captain?

Jhon Mark Enrique: Na eedit pa po yung pangalan ng captain yun lang po sa template ng certificate.

Lester G. Diampoc: Yung mga documents ba na nirerequest sa barangay may mga bayad?

Jhon Mark Enrique: Libre lang po

Lester G. Diampoc: Gaano katagal yung duration for the request

Jhon Mark Enrique: Sa manual process po nila is nagtatagal siya ng 3 days and para po sa system po natin is matik po

Lester G. Diampoc: what do you mean by matik? Kasi pag sinabing automatic wala nang human intervention but still i approve pa rin ni admin diba? So hindi siya matik so in that case may possibility siya na ma delay kasi dapat naka monitor sila jan e

Jhon Mark Enrique: Then yun po yung sa part na pano po nagrerequest ng certificate si resident and pano nag aapprove si admin. Then other features are meron po tayo sa part na dashboard.

Era Marie Ganaban: User Account Management tayo according to your user requirements.

Jhon Mark Enrique: Sa account management po namin profile picture, name, email and add family member and edit information ni user. Then meron tayong family member dito and pending request. So, sa may add family member mag se-search tayo kung sino yung family member na naka register sa site namin. Example Santes ang ating family member then add as family. Then makikita tayo kung ano relation to the family na meron tayo sakanya. For Example, siya ay ating brother then confirm. So papasok sya dun sa account ni Santes na magkakaroon sya ng pending request and need nya iaapprove na sya yung family member na meron sya, na family member nya si Jay Em Enrique. Then lalabas dito na no pending request ibig sabihin wala pang nag rerequest na sya yung family member. Then meron din tayong login history and personal information.

Era Marie Ganaban: It does not match to your user account management requirement.

Lester G. Diampoc: Ano yung purpose nung pag add ng family member?

Jhon Mark Enrique: Doon na po papasok sir yung malalaman sino yung family member nila sa isang bahay. Bali parang tulad po kay fb na iindicate nya dun kung sino yung family member nya and para din po sa census din nila or kung sino yung household or head of the family sa tahanan na yon sir.

Bucad: May Data Privacy Consent yan?

Jhon Mark Enrique: Meron po sir

Lester G. Diampoc: For generating other information or other purpose so nag generate ng ganon? So let's say for example gusto malaman nung barangay kung ilan yung sum so nag generate sya through that particular?

Jhon Mark Enrique: For now sir is wala pa yung sa bibilangin kung ilan member don. Meron lang sir kung sino yung magkakapamilya lang sa isang household or sa family.

Lester G. Diampoc: Oo nga so ano nga purpose non? Kung bakit kailangan? Kung saan mo sya gagamitin?

Jhon Mark Enrique: Gagamitin po sya sir para malaman po each household kung sino po yung nakatira and sino sino po yung magkakakilala magkakamag anak. Yun po sa one of request po samin po sa barangay po para po ma monitor po nila kung ilan and sino yung family member ng household.

Lester G. Diampoc: Hindi pa nakakapag generate ng report?

Jhon Mark Enrique: Nakakapag generate na for names lang po hindi nya pa po naco-count kung ilan

Lester G. Diampoc: So wala pang summary?

Jhon Mark Enrique: Yes po

Era Marie Ganaban: Okay i ano na natin to ah proceed na tayo sa question and answer. Sir Lester meron ka pang tanong?

Lester G. Diampoc: Sige lang mamaya

Era Marie Ganaban: Abel?

AbelardoBucad: Wala naman

Era Marie Ganaban: Give us 10 mins to scan your documents

Era Marie Ganaban: Are you done with your demonstrations?

Jhon Mark Enrique: Yes ma'am

Era Marie Ganaban: Give us 10 minutes

Abelardo T. Bucad: Saan nanggaling dataset? Kaggle?

Jhon Mark Enrique: Yes po sir

Lester G. Diampoc: Kailangan ba yung magrequest ng mga document is from the barangay? May voters from that particular barangay

Jhon Mark Enrique: Ah hindi naman po sir

Lester G. Diampoc: Not necessarily so pwedeng taga ibang barangay?

Jhon Mark Enrique: Yes po as long as nakatira po sa barangay

Lester G. Diampoc: Sa part ng barangay. Dapat lang kase aq di aq botante

Lester G. Diampoc: How will your system guarantee that the information of the resident would not be tampered or can be used for other purposes.

Jhon Mark Enrique: Ah in database sir we implemented the encryption pagpasok po ng data. So there are two layers po sa encryption namin. First layer po is the default for laravel and second one is kung ano po yung kasunod na letter dun sa encryption nya mag bypass po dun sa papalitan nya po yung letter na meron.

Lester G. Diampoc: Kase I guess aware naman kayo kung ano yung usual na nangyayari sa barangay diba. Normally nagagamit yung names ng mga residents ng barangay for different purposes. Normally palakasan kase diba meaning malapit sa barangay. Tapos try to validate or confirm kung ganon talaga yung process if ever wala yung dalawang humahawak ng system, yung barangay captain na yung maghahawak. Hindi sya realistic. Normally its a secretary talaga eh.

Jhon Mark Enrique: I-address po namin sa barangay.

Lester G. Diampoc: Try nyo lang baka meron pang ibang pwede. Kung wala na talaga, wala na lahat ng kagawad that is the only time na lalo kung immediate. Kung hindi naman immediate yung concern hindi pagkakaabalahan ng barangay captain yan to check yung mga request okay? So gagawin nya mag approve diba di siya part.

Lester G. Diampoc: So what if for example may mga request na hindi dumaan doon sa system

Jhon Mark Enrique: Ah what do you mean sir

Lester G. Diampoc: Yung mga manual

Jhon Mark Enrique: Napprocess padin po sir. Bali meron kami sir na walk-in process po doon sa admin side.

Lester G. Diampoc: Yung docu ba na transaction hindi ba sya ma iinclude dyan?

Jhon Mark Enrique: Maiinclude padin po sya

Lester G. Diampoc: Hindi man sya dumaan dyan pero meron provision yung system nyo. Para ma monitor kase lahat. Pano yon? Kunwari may nag apply pero hindi sya gumamit ng system nyo.

Jhon Mark Enrique: Bali sir dadaan muna sya sa barangay kay record keeper then from there po is mag fi-fill up na po sya sa system namin ng form from admin side then from there after nya mag fill-up is papasok na po sya agad hindi po sa approval which is doon sa in process na po yung account nya. Then ipprocces na po dire-diretso.

Lester G. Diampoc: Yung secretary or record keeper na yung mag eencode?

Jhon Mark Enrique: Yes po. Bibigay nalang po sya ng details nya.

Lester G. Diampoc: Which is supposedly ang gagawa dapat is yung resident diba parang ganon. Instead na yung applicant e yung mismong secretary na yung gagawa.

Jhon Mark Enrique: Iniisip po kase namin baka po walang internet si resident.

Lester G. Diampoc: Tapos meron syang physical form.

Jhon Mark Enrique: Yes po.

Lester G. Diampoc: Kase importante sa general report sino nag apply ng ganito.

Era Marie Ganaban: Teka malapit na q baka mga 2hrs. Ilang images tong tineset nyo? Front, Left, Right?

Jhon Mark Enrique: Yes ma'am

Era Marie Ganaban: Same calculations?

Jhon Mark Enrique: Yes po

Abelardo T. Bucad: Saan ginamit yung YOLO?

Jhon Mark Enrique: Yung sa YOLO part po sir for image detection po sa face recognition. Sa valid ID po and sa face capture.

Lester G Diampoc: Ano yung minimum requirements sa system?

Jhon Mark Enrique: Kahit lower version po ng Chrome like 6.3 po na version and any browser like google chrome, opera gx, safari.

Lester G Diampoc: Sa Hardware requirement?

Jhon Mark Enrique: Sa hardware requirement po is 4GB RAM po atleast intel i3 processor.

Lester G. Diampoc: Pero the higher the better no?

Jhon Mark Enrique: Yes po.

Lester G. Diampoc: Colored ba yung pag print ng certificate?

Jhon Mark Enrique: Yes po sir mamimili nalang po sila if colored or black and white lang sir.

AbelardoBucad: Bakit may results yung chapter 3? Results should be in chapter 4. So chapter 3 lahat ng methods pano gagawin step by step. Di nag mamatch yung evaluation nyo sa abstract. Tama ba? Chapter 4. Ilang model ba ginamit nyo?

Clyde Canlas: Dalawa po sir. YOLO and CNN po.

AbelardoBucad: Eto ang CNN? Eh eto? San na yon

Clyde Canlas: Sample table lang po sir

AbelardoBucad: Sample table e result nga to. Yun oh model training. Result to?

Jhon Mark Enrique: Yes po sir

AbelardoBucad: Eh eto?

Jhon Mark Enrique: Yung sa metrics po ng bawat model sir.

AbelardoBucad: Eh eto model din to e

Jhon Mark Enrique: Eto po sir yung sample result na kinuha namin sa each model na tinrain po namin sir.

AbelardoBucad: Kaya nga so eto yung model? Saan nanggaling to? Paano nyo kinompute to? Mano mano hindi? Testing result yan? Eto evaluation result? So alin talaga ang tunay? Eto?

Clyde Canlas: Opo sir

AbelardoBucad: 1 dapat?

Jhon Mark Enrique: Yes po

AbelardoBucad: So eto hindi?

Clyde Canlas: Hindi lang po natangal sir parang sample lang po.

AbelardoBucad: Pano nyo to timest?

Jhon Mark Enrique: Sa model training po namin.

Abelardo T. Bucad: Eto yung naging result?

Jhon Mark Enrique: Yung isa sir then eto sir sa pagkakaalala ko sir nilagay ko lang sa part na to pero sir wala kami lumabas na 0.8, 0.9.

Abelardo T. Bucad: Pero nandito

Jhon Mark Enrique: Kase ang mostly kase sir ang lalabas dapat is 1 for CNN.

Abelardo T. Bucad: Eto pa naman yung tama.

Jhon Mark Enrique: Mag sstick ako sa 1 sir.

Abelardo T. Bucad: Walang one, walang one na result. Overfitting yan. Yan oh puro one. Tignan mo hindi pa sya balance 1 dito tas .4. Diba ano sya ibig sabihin may something sa data.

Jhon Mark Enrique: Either po sir sa data or sa pag train ng model.

AbelardoBucad: So ano pinili nyong algo?

Jhon Mark Enrique: Nag combine na po kami ng CNN and YOLOv8.

Abelardo T. Bucad: Pag iniscan yung ID ano tinitignan doon? Yung ID lang or yung picture lang?

Jhon Mark Enrique: Picture lang sir

Era Marie Gannaban: Are you done Sir Abel? Okay sige ako na. Before I speak, Sir Lester do you have anything else or later?

Lester G Diampoc: Later

Era Marie Gannaban: I'll start with your system requirements. What you demonstrated, and what is included in your system requirements does not match exactly pero yung minimum requirements nakita ko sya so that's a total of 16/16 including the verification. 100% demonstrated yung functional requirements based on your paper. However you demonstrated some that was not included so hindi ko na sya na count as part of the functional requirements nyo. Nagegets nyo ba? Kase kung ano ang nasa paper that's the rule diba? Whatever is on your paper is yun lang yung titignan q kahit madami pa kayong meron dyan sa application nyo. Congratulations on that. However, I'll start with the purpose and description of the study. So the study aims streamline processes such as certificate request, inquiry, and verification. How did you streamlined the process?

Clyde Canlas: We reduced the manual ano po

Era Marie F. Gannaban: Yes that's the execution. Nireduce nyo yung manual process kaya sya nagkaroon ng transformation. Did you identify the citizen charter of document request? Kase doon natin madedetermine kung ilang days, kung ano yung turnaround time ng manual process versus streamlined.

Clyde Canlas: Yung turnaround time po maam around 3 days po pag nagrequest po si resident around 3 days po makukuha yung certificate and kung bbase po natin sa system namin 1 day process po sya.

Era Marie F. Gannaban: Okay based on experience, ganon na talaga sya nagwork however it was not included in your system.

Abelardo T. Bucad: Based sa experience ko, sakin hindi. 30 mins lang.

Era Marie F. Gannaban: Sa West kase one day. Yun so magkakaiba tayo ng turnaround time don and that is because hindi sya stated dito sa paper ninyo so we cannot prove na nagkaroon ng streamlining is that clear? We can identify that through the citizen's charter. And then dito sa objectives nyo you wanted to develop an application that will securely and efficiently identify or verify the identity of residents that will secure and efficiently identify or verify the identity of the residents. What you showed is scanning ng face, paano nagkaroon ng security and efficiency doon?

Jhon Mark A. Enrique: Yung sa security mam is yung pagpasok sa database and minimum of 5 minutes lang po siya pwede makapag scan ng face.

Era Marie F. Gannaban: dalawa dapat yung minamake sure niyo diyan eh yung sa dataset but also yung accountability, confidentiality diba yun yung nasa iso25010 so hindi ko siya nakita sa paper how can you say that it is efficient

Abelardo T. Bucad: CIA confidentiality, integrity accountability

Era Marie F. Gannaban: Ay hindi ko alam yun eh iso25010 lang ako, about the efficiently how can you tell that you developed an application efficiently?

Clyde D. Canlas: Nagwork po yung mga features specifically yung sa face and makapagrequest po si user ng mga certificate and makapag update po siya ng mga information.

Era Marie F. Gannaban: efficiently does not mean accuracy so magkaiba yon so i think i suggest you remove this part kasi makikita naman to sa evaluation okay, tapos dito yung design and develop a web base

application i suggest do it by module para pag ginawa niyo yung requirements nagmamatch na

Functional nakita ko kanina yung precinct no. is by selection, drop down i think medyo prone siya sa error especially numbers kasi siya diba medyo nakakaduling especially

kunwari click ko yung nasas taas tapos yung nasa baba yung na click, are there any other way that can determine na this person belongs to a certain precinct no.

Jhon Mark A. Enrique: pwede po namin is gamitin yung part na parang searchable

Era Marie F. Gannaban: paano ba dinedetermine yung precinct no.

Jhon Mark A. Enrique: voters certificate po.

Era Marie F. Gannaban: so pwede niyo kunin yung voters id

Jhon Mark A. Enrique: pero pinatanggal po nila samin yung part ng pag upload ng voters certificate kasi daw po yung iba is nahihirapan daw po kumuha ng voters certificate

Era Marie F. Gannaban: so data entry lang talaga, selection talaga so medyo prone yun ah you need to include that to your scope and limitations, and then you mention earlier that you have a problem with the api

Location, how comes is that?

Jhon Mark A. Enrique: Nangyayari po sa api location po mam is free lang po kasi siya. Kunwari po mam nasa manila po ako ngayon, ay nasa makati po ako pero na determine po siya na nasa quezon city but in other locations naman po like if im in manila then nalolocate po siya in manila so doon po yung medyo.

Era Marie F. Gannaban: but your api is integrated with on your application?

Jhon Mark A. Enrique: Ah in part of detecting location

Era Marie F. Gannaban: so paano siya nagkaroon ng problem eh web service yon your calling it via url

Jhon Mark A. Enrique: isa pong possible na error na naencounter ko po diyan is possible po yung sa mismong location ng device na meron ako

Era Marie F. Gannaban: location ng device? Parang imposible parin siya eh kasi web service yan eh url lang eh naka end points kayo tama ba?

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: unless it is not properly integrated

Jhon Mark A. Enrique: double check ko po mam

Era Marie F. Gannaban: baka mali end points niyo, next one hindi ko nakita yung certificate management pero you demonstrated it so its not part of your

Era Marie F. Gannaban: di meron sila non diba yung magseselect ng kagawad na magsasign tapos may picture

Era Marie F. Gannaban: hindi, hindi siya part ng kanilang paper so maganda sana siya kaso hindi siya considered as requirement ninyo. And then for the user account management, search also is not included and then user account management niyo does not match with what you are demonstrating tapos, teka lang ah. Yung sa definition of terms some of the terms are optional naman tapos

Okay experimental and controlled variables niyo that you can say na nagkaroon ng experimental research?

Jhon Mark A. Enrique: mam dataset po ba tinutukoy niyo?

Era Marie F. Gannaban: no, diba para masabi nating controlled variables ay experimental siya

Lester G. Diampoc : may control at may experimental may dalawa kayong group na tinitignan.

Era Marie F. Gannaban: yes, may dalawa kayong group na tinitignan

Lester G. Diampoc : malalaman niyo kung effective to kasi nagexperiment kayo base dito

Jhon Mark A. Enrique: pwede po isama nalang yan manual process

Era Marie F. Gannaban: hindi meron yan, ah ok nung thesis1 niyo pinadetermine ko sainyo yung base ng algorithm facial recognition, dapat either mas mataas ang inapply niyo o dapat mas mataas ang naapply niyo kasi hihigitan niyo nga yung minimum eh however its not identified here kaya hindi ko siya masasabing experimental tama ba? Tapos you explain further yung experimental developmental dapat nasa rrl na ito ha. And then the same with this ayan oh nagmukha siyang RRL. Tapos agile yung approach natin pero hindi ko naintindihan eh sa planning, ano ang delivery? Era Marie F. Gannaban: ng planning?

Jhon Mark A. Enrique: meetup with the client

Era Marie F. Gannaban: what else?

Jhon Mark A. Enrique: requirements analysis

Era Marie F. Gannaban: requirement analysis correct, however and nandito ay project description and background of the barangay okay so this is not a requirements rather yung background of the study yung plano ninyo na ano magiging itsura nung dinedevelop niyong system, functional requirements is missing. Tapos although nakita ko yung functional requirements siguro pwede niyong gawin is ilipat nalang dito. And then this is not a user story alam niyo yan, diba dalawa yung format ng user story when then i believe, use case ninyo wrong use of include and extend tapos some of the use cases dito sa use case ninyo is not listed into your specific objective i think you must stick to your specific objective. Yung ERD niyo i am trying to figure out kung nasaan yung cardinalities yung mga keys such as primary keys candidate keys hindi ko siya nakita so i cannot tell how your ERD works and then wrong labels for the data flow symbols for the data diagram, diagram 0 may limit ang data flow diagram up to 9 lang more than 9 magiging complex na siya, okay so ang dami niyo rin black hole ibig sabihin merong inputs pero walang outputs tapos ang daming manual process dito just like this nung nag create ng account pinasa sa user database, and who is this user database? After 1.0. So ang nangyari pagtapos ko magcreate ng account binigay ko sa kanya physically yung data siya naman ininput niya kasi may entity kayo dito. Entity is an information as well so i want you to revise this umabot kayo ng up to 11 and then project description itong mga screenshots na to ano ba ito? Mid fidelity high fidelity?

Jhon Mark A. Enrique: High fidelity mam

Era Marie F. Gannaban: ah high fidelity acceptable, okay so nagkaroon kayo ng feature extraction nakita ko naman yung feature extraction ninyo kaya lang medyo nalilito ako kasi from this image nag grayscale kayo diba?

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: tapos dinetermine niyo pixels doon sa grayscale image tapos na determine niyo yung actual number kung saan located yung shades of gray tapos yun yung kinuhaan niyo ng coordinates tapos yun na nawala na, diba pagkatapos mo kuhain yung pixels doon sa coordinates idetermine mo yung x value y value and then idetermine niyo kung nagkaroon ng intersection over union. Tama ba ako?

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: okay so, hindi ko siya nakita

Abelardo T. Bucad: hindi ko rin nakita

Era Marie F. Gannaban: tapos so after niya nagkaroon ng feature extraction nagkaroon ng face comparison diba ang face comparison after ng extraction sa intersection over union is from this dataset for example yung picture mo kanina will be compared to the 5000 datasets that you have, tama?

That is your score for precision recall and f1, tama? So wala siya dito okay i think you missed that part then .h5 or hp5?

Jhon Mark A. Enrique: ah yung sa ano mam pag nagtrain ka ng model mam nagiging .h5 yung file

Era Marie F. Gannaban: ah h5 pala, okay next post estimation ground truth kasi ito na yung part na, na determine na yung yung pixel, coordinates so idedetermine nalang dito kasi nose, chin, eyes dami niyo naman kasi tinst dapat face lang tinst niyo para nakuha na natin diba so in tihs part na kinukuha niya yung nose tsaka chin from the k value, tama ba ako? Anong k non? Nilagay niyo lang yung x, y, z so ibig sabihin naka surround lang yun

Jhon Mark A. Enrique: opo mam sa face lang

Era Marie F. Gannaban: so paano sa mag dedetermine doon sa center point ano ba tawag don centroids? Centroids?

Jhon Mark A. Enrique: Centroids po mam

Era Marie F. Gannaban: Centroids pala

Jhon Mark A. Enrique: bali don sa ano mam sa mid nose po yung chinecheck namin.

Era Marie F. Gannaban: oo nga kaso z, y, z lang siya paano madetermine na yung centroids niya ay nasa 4, 5?

So eto na siya, tama ba? Ito yung x niyo ito yung y niyo ito yung z niyo

Jhon Mark A. Enrique: yes po mam.

Era Marie F. Gannaban: so itong 0.5 0.6 weight?

Jhon Mark A. Enrique: yes mam

Abelardo T. Bucad: chapter 3 yan?

Era Marie F. Gannaban: hindi, ah tama nasa chapter 3

Abelardo T. Bucad: pero result na yan o formula?

Era Marie F. Gannaban: ah hindi way para ma extract tama ba ako? Ano palang siya detection

Jhon Mark A. Enrique: yes mam

Era Marie F. Gannaban: tapos unbelievable no nag lighting estimation talga kayo

Era Marie F. Gannaban: tama naman yon may lighting estimation kasi doon madedetermine kung nose talaga diba, so paano ba tong sa lighting diba may range din ito?

Jhon Mark A. Enrique: opo mam

Abelardo T. Bucad: problema may result na?

Era Marie F. Gannaban: wala eh nag lighting lang sila eh, nag contrast pala

Abelardo T. Bucad: sa chapter 4 may result yan?

Era Marie F. Gannaban: wala

Abelardo T. Bucad: wala useless yan

Era Marie F. Gannaban: oo useless pero ginawa kasi nila, so nag contrast kayo with the use of 0-100

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: anong values niya?

Jhon Mark A. Enrique: 85 po yung sa threshold niya

Era Marie F. Gannaban: useless siya ksi inexecute nila pero hindi ko napansin sa chapter 4, next 256, 200 pixels?

Jhon Mark A. Enrique: 256 mam

Era Marie F. Gannaban: okay, then ito yung result niyo ng contrast sa lighting

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: okay so dapat nasa chapter 4 ito. Tapos na determine na natin yung xyz, iou? Intersection over union na compute niyo?

Jhon Mark A. Enrique: intersection over union mam?

Era Marie F. Gannaban: oo did you compute that?

Jhon Mark A. Enrique: yes po mam pero hindi po nalagay sa chapter 4

Era Marie F. Gannaban: okay sige, then ito yung centroids niyo?

Jhon Mark A. Enrique: opo mam

Era Marie F. Gannaban: okay, tapos kelangan lang natin i measure dito is yung centroids niyo ha, ito ba tong nasa gitna yung paganon?

Jhon Mark A. Enrique: yes mam

Abelardo T. Bucad: kaninong mukha yan?

Mary Ellaine R. Cervantes: kay Jhon Mark A. Enrique

Era Marie F. Gannaban: ah talaga bakit parang mataba. So 2d tsaka 3d

Jhon Mark A. Enrique: yes mam

Era Marie F. Gannaban: ang comparison niyo, bakit?

Jhon Mark A. Enrique: ay ano lang mam 2d

Era Marie F. Gannaban: pero may xyz kayo kanina 3d yon, so ano talga ang balak niyo 2D o 3D?

Jhon Mark A. Enrique: 3D

Era Marie F. Gannaban: okay so anong gusto ng group focus on 2D or 3D?

Era Marie F. Gannaban: okay tapos itong 0.5 0. Something weight?

Jhon Mark A. Enrique: yes po mam sa treshhold po mam

Era Marie F. Gannaban: sa treshhold, okay so ibig sabihin ang base niyo ay 0.5 ang acceptable

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: so ang 0.3 is not acceptable?

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: 0.7 is very good tama?

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: alright, so 0.3 is not acceptable?

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: pero 1.0 ang result niyo, nakita ni sir Abelardoyon. Pero 0.3 nakuha niyong result dito so which is which?

Jhon Mark A. Enrique: ah yung sa part ng 0.3 is nag create kami ng sample data para ma empahase lang namin yung data na nakuha parang sample lang po siya

Era Marie F. Gannaban: into 5000 datasets?

Jhon Mark A. Enrique: yes po mam

Era Marie F. Gannaban: then maghintay kayo and dami niyo nilagay eh, so ito na yung IOU niyo, IOU niyo to? Wala lang result sa chapter 4. Tapos ito naman yung actual execution niyo ng pseudo code.

Jhon Mark A. Enrique: yes po mam.

Era Marie F. Gannaban: move to appendix ha

Jhon Mark A. Enrique: yes po mam.

Era Marie F. Gannaban: Okay so ito na yung 16 out of 16 ibig sabihin system is functional 100% base on the system requirements. Tapos ito yung evaluation ng result ng CNN Faster CNN and YOLO tama? So nasa design algorithm ito.

Abelardo T. Bucad: result na yan?

Jhon Mark A. Enrique: training po siya

Era Marie F. Gannaban: result parin siya

Abelardo T. Bucad: sa chapter 4 yan

Era Marie F. Gannaban: pakitable nalang, tapos nag pre process kayo tapos nag data clean ulit kayo.

Abelardo T. Bucad: Oo nga.

Era Marie F. Gannaban: So redundant siya.

Abelardo T. Bucad: Dinami dami niyo ang dami tuloy comment.

Era Marie F. Gannaban: considEra Marie F. Gannabantion details so ibig sabihin ito yung pag upload niyo ng manage using laravel

And server path secure so pipeline. Nasaan ang pipeline nito? Okay so sinabi niyo nag automate kayo using laravel. Paano kayo nag automate? Eh mvc na yon

Abelardo T. Bucad: Yung sa laravel naka mvc na yon eh.

Era Marie F. Gannaban: Paano niyo siya na automate?

Abelardo T. Bucad: Laravel na siya eh.

Era Marie F. Gannaban: Oh bakit nag automate pa kayo?

Mary Ellaine R. Cervantes : Baka mam dinidiscuss lang nila yung laravel na nag automate ang laravel

Era Marie F. Gannaban: Regression testing paano niyo ginawa?

Jhon Mark A. Enrique: Kay regression mam si jmeter na po ang papasok don yun nga lang po hindi po nagiging accurate yung result.

Era Marie F. Gannaban: Regression testing is testing over and over so minimum of 5 times yon just to check kung nagkaroon ng integration effect. Anong result ng load testing?

Jhon Mark A. Enrique: Si load testing mam 0 error then 90%.

Era Marie F. Gannaban: Wrong load testing ay resource utilization and loading time, ilang minutes yon?

Jhon Mark A. Enrique: 3.0 per sec

Era Marie F. Gannaban: Hindi ko siya nakita sa result ilang threads yon?

Jhon Mark A. Enrique: Hindi ko po sure kung ilang threads yon.

Era Marie F. Gannaban: Run it again for 1000. Remove conclusion from chapter 3, i think you can remove this part na including itong mga script meeting ninyo with your technical advisor and course advisors. Tapos real time monitoring remove niyo na ito kasi hindi naman talaga kayo mag rereal time monitoring. Okay so i agree with sir Abelardo over fit tapos hindi nag match kasi .4 pero 1.0 yung recall parang 40% out of 5000 dataset ang narecall niya pero ang accuray result is 100%

Abelardo T. Bucad: Ano yung accuracy? .4? Ang baba

Era Marie F. Gannaban: Recall pala ang 100% ibig sabihin na rerecall ng 100% out of 5000 dataset pero ang accuracy niya is 40% lang
Abelardo T. Bucad: Sa confusion matrix samahan niyo ng confusion matrix.

Era Marie F. Gannaban: Naconfuse tuloy tayo. Tapos stress test di siya nag match sa sinabe niyo 3.7 sabi niyo, 4.31. Okay 1000 users ah hindi pwedeng 20 users lang. Masyadong mababa ang 20 users.

Injection?

Jhon Mark A. Enrique: yung sa part ng injection bali kay IT expert na part po yun.

Era Marie F. Gannaban: Okay ah, hindi ko kasi nakita tong range values sa software evaluation. Tapos tinst niyo talaga yung integrity, how did you test the integrity?

Jhon Mark A. Enrique: sa integrity

Clyde D. Canlas: Security

Era Marie F. Gannaban: Oo under siya ng security, kayo naman nag sql injection na kayo hindi niyo pa pinatest sa IT expert niyo. Tapos summary of findings paki outline base on the specific objectives then naulit yung test plan niyo sa appendix. Thats it, maybe we can move ay anything to say?

Abelardo T. Bucad: Okay na yan mabubugbog na kayo eh.

Mary Ellaine R. Cervantes : Labas muna kayo guys magdedeliberate lang yung mga panels.
