

ANNE LORRAINE F. RAMOS
IV-BCSAD

Attending the STEM VIBE NYSTIF 2024 on its last day, September 21, 2024, was an incredibly exciting experience for me. From the moment I walked into the event, I could feel the energy in the air—an energy fueled by the collective passion of hundreds of STEM enthusiasts, researchers, and innovators. I was thrilled to be a part of this vibrant community, and the day's events left me both inspired and hopeful about my own future in STEM.

One of the most exciting aspects of the event was the abundance of freebies that were generously handed out. It was like being in a treasure trove of useful gadgets, educational resources, and keepsakes that I knew would benefit me long after the event ended. Among all the freebies, one that particularly stood out to me was a USB drive. While it may seem like a simple, everyday item, I knew it would be incredibly useful for my academic and personal work. In UMAK, where data storage and file management are essential, this USB felt like a practical tool I could carry with me wherever I go. I found myself smiling as I tucked it into my bag, already thinking of the many times it would come in handy for my projects.

However, the freebie that truly took my breath away was not a physical item, but rather an opportunity—an offer from the Department of Science and Technology (DOST) for scholarships to those interested in pursuing their master's or PhD. As someone who has always dreamed of advancing my education and diving deeper into my chosen field, this was a game-changer. The idea of receiving financial support to continue my studies made my heart race with excitement. Knowing that the DOST was investing in the future of STEM students like me gave me a sense of validation, and it felt as though the universe was giving me a nudge toward achieving my academic aspirations.

Throughout the day, I couldn't stop thinking about the possibilities that the DOST scholarship would open up for me. Pursuing a master's or PhD is not an easy feat, and the financial strain has always been a concern of mine. But with the scholarship offer, it felt as if a heavy weight had been lifted off my shoulders. The idea of contributing to the STEM field through advanced research, developing new technologies, or solving complex problems excited me beyond words. I kept envisioning myself standing at the forefront of innovation, empowered by the knowledge and skills I would acquire through a postgraduate program.

The atmosphere at STEM VIBE NYSTIF 2024 was buzzing with opportunities, and every booth I visited seemed to offer something unique and inspiring. But it was the DOST scholarship that made the event truly memorable for me. It felt like the start of something big—an opportunity not just to continue learning, but to make a lasting impact in my field. As the day ended and I walked away with my USB in hand, I realized that the event had given me more than just gadgets; it had given me a renewed sense of purpose and excitement about the future.

In the end, the STEM VIBE NYSTIF 2024 wasn't just an event—it was a turning point for me. The freebies were fun and practical, but the real prize was the opportunity to take the next step in my academic journey. I left the event feeling inspired, motivated, and ready to take on whatever challenges the future may hold.
